

'react-redux'

It makes your life easier

REVIEW

 **React** is a library that lets us build component-based user interfaces

 **Redux** is a library that manages state in a predictable way

We can use them together, but there's a *bunch of code* that we have to write *every time* we want a component to be connected up to the store:

- `componentDidMount + store.subscribe + etc.`
- `componentWillUnmount + unsubscribe`

ENTER... REACT-REDUX

React-Redux allows us to abstract and simplify our applications that use *React* and *Redux*

By the end of today, you will be able to...

connect a *React* component to the *Redux* store,
mapping necessary **state** and **dispatch** actions to **props**

Let's dive in!
